

Swathi Mannem

Email: swathimannem453@gmail.com

Contact: +91 9182312449

Professional Summary:

- Overall, 3 years of experience as a Software Engineer in Mainframe applications.
- Experience in **Mainframe Migration Project to AWS**.
- Involved in Overall Data Migration from Mainframe to AWS.
- Hands on Experience on Microfocus Cobol, Data Studio, Enterprise Server, ZENA.
- Experience on Git-hub for deploying code and adding new code changes.
- Experience in application development, enhancements and supporting batch processes hosted on an IBM mainframe using COBOL, JCL, DB2, VSAM, TSO/ISPF, ENDEVOR, FILE-AID, QMF and SPUFI.
- Experience includes Unit testing and technical support during business hours.
- Participate and contribute in the Low-Level Design for the required flows and business logic using Cobol, DB2, JCL technologies.
- Involved in weekly knowledge sharing sessions.
- Excellent Analytical, problem solving, communication and interpersonal skills with ability to interact with individuals at all levels.
- Highly motivated, committed and results-oriented software professional.
- Strong problem analysis & resolution skills and ability to work in multi-platform environments.

Educational Qualification:

Bachelor of Technology - Electronics and communication engineering(ECE)
Marri Laxman Reddy Institute of technology & Management, Hyderabad.

Employment details:

- Working as Analyst II Software Engineering in DXC From January 2022 till Date.

Technical Skills:

- **Operating Systems** : OS/360, Z/OS ,Windows, Linux
- **Languages** : Microfocus COBOL, SQL, COBOL, JCL
- **DBMS** : DB2
- **Access Method** : VSAM
- **Tools and Utilities** : Eclipse for Micro focus Enterprise developer, IBM Data Studio, Micro focus enterprise Server Administration(ESCWA server), TSO/ISPF, FILEAID, Endeavor, Xpeditior, SPUFI, Service Now , GIT-Hub, Jenkins, ZENA(Scheduler), Kubernetes, WinSCP.

Current project:

Project : Impact Transformation
Role : Analyst II Software Engineering
Client : Lincoln Financial Group
Company : DXC Technologies
Duration : October 2023 – Present

Environment: JCL, COBOL, VSAM, DB2, ENDEVOUR, FILE-AID, SPUFI, Microfocus Cobol, Eclipse, Microfocus RUMBA, AWS cloud, IBM Data Studio. ZENA (Scheduler). Git-hub. Jenkins, Kubernetes.

Project Description:

Our Project Transformation of Impact is focused on to transfer the existing JCL, Files, PROC, RUN Components and DB2 Database to AWS Database. During the discovery phase, the data sources along with applications are assessed for compatibility with target architecture, and the integration points are assessed for smooth migration. Qualitative and quantitative analysis are performed on source data to choose the right set of tools and migration activities. Assessment tools like Micro Focus Enterprise Analyzer, along with custom-built scripts, is used to assess the mainframe data.

Migration

Migration involves schema and data migration to target systems. Before production cutover, it will be tested repeatedly in test environments to avoid any data loss during cut over.

Post-Migration

Post migration, the migrated data will be validated and reconciliated against the source system for data consistency. Functional and performance testing can be carried out to further ensure data migration meets the expected goals of the transformation project.

Roles & Responsibilities:

- Created and assisted the team in setting up the AWS workspace.
- Collaborated with cross-functional teams to analyze legacy COBOL applications, rewriting, and optimizing code for AWS compatibility.
- Jenkins and Git for efficient application deployment.
- Programmed and maintained COBOL applications on the mainframe, ensuring optimal performance and adherence to industry standards.
- Conducted code reviews and implemented best practices to enhance the reliability and maintainability of applications.
- Successfully migrated legacy COBOL applications to AWS, ensuring minimal downtime.
- Jira Defects: Analyzed, debugged, and implemented solutions.
- Debugged in both Linux in Kubernetes and on Windows in Eclipse.
- Created jobs and control cards to DELETE and DEFINE the VSAM files.
- Analyzed the files and mapping the file with appropriate layout for the files which have comp, signed and zoned decimal values.
- Using PowerShell, Migrated JCLS, COBOL modules, copybooks, control cards, from mainframes to AWS and tested them in eclipse.
- Converted modules from Easytrieve to COBOL.
- Converted ASCII to EBCDIC and EBCDIC to ASCII through Jobs and through Classic data tools.
- Upload and transfer files, start stopping the server, running queries through JENKINS.
- Handled the Zena operations like hold, skip, release, set to cancelled, set to normal thoroughly. Releasing jobs through Zena and monitoring them on server.

Previous Project:

Project : Concord Vantage Transformation
Role : Analyst II Software Engineering
Client : Lincoln Financial Group
Company : DXC Technologies
Duration : January 2022 – Oct 2023

Environment: JCL, COBOL, VSAM, DB2, ENDEVOUR, FILE-AID, SPUFI, Microfocus Cobol, Eclipse, Microfocus RUMBA, AWS cloud, IBM Data Studio. ZENA (Scheduler). Git-hub. Jenkins, Kubernetes.

Project Description:

Our Project Transformation of Concord Vantage is focused on to transfer the existing JCL, Files, PROC, RUN Components and DB2 Database to AWS Database. During the discovery phase, the data sources along with applications are assessed for compatibility with target architecture, and the integration points are assessed for smooth migration. Qualitative and quantitative analysis are performed on source data to choose the right set of tools and migration activities. Assessment tools like Micro Focus Enterprise Analyzer, along with custom-built scripts, is used to assess the mainframe data.

Migration

Migration involves schema and data migration to target systems. Before production cutover, it will be tested repeatedly in test environments to avoid any data loss during cut over.

Post-Migration

Post migration, the migrated data will be validated and reconciled against the source system for data consistency. Functional and performance testing can be carried out to further ensure data migration meets the expected goals of the transformation project.

Roles & Responsibilities:

- Involved in overall migration Process from Impact Analysis, Coding and Testing on the Target System.
- Design data migration methodologies for handling historical and current data migration from Mainframe to AWS.
- Perform code analysis to identify the process flow and dependencies.
- Re-compile COBOL components using Microfocus Enterprise Developer Tool.
- Preparation of Technical Design document, Co-ordination with Cross functional team for build and unit testing.
- Used Micro Focus Enterprise tools to re-host Mainframe in AWS
- Involved in the conversion of VSAM, PS files to bring the Files from Mainframe to AWS
- Migrated the EBCDIC Data in ASCII from Mainframe to AWS.
- Executed all the JCL on Microfocus Enterprise Developer to test and validated the results by Comparing the outputs from Mainframe JOBS.
- Used Jenkins for Data Transfer, Database Backup and Restore.
- Used Kubernetes for AWS Linux environment.
